

Dear Hiring Team,

Driven by a deep interest in technology and problem-solving, I have consistently sought opportunities to explore, build, and apply data-driven and software-oriented solutions. My academic background, strong coding skills, and diverse project portfolio have shaped my foundation to contribute effectively to fast-paced tech environments.

I secured a position among the top 1.65 percentile in the JEE Advanced exam and pursued a B.Tech at IIT Bombay, where I developed a rigorous understanding of core engineering principles and honed my analytical and coding abilities. My coursework, complemented by self-initiated projects, allowed me to transition seamlessly into applied domains like Machine Learning, Data Science, and Software Development.

Throughout my undergraduate journey, I executed a wide range of tech projects. I developed end-to-end ML pipelines for **Customer Churn Prediction** and **House Price Prediction**, incorporating data preprocessing, model tuning (with tools like GridSearchCV), and deployment using **Streamlit** and **joblib**. I also built a **GitHub Repo Analyzer** that fetched real-time data via APIs, processed it using **pandas**, and visualized it using **matplotlib** — all embedded in an interactive web app. These projects not only strengthened my command over Python and ML libraries like **scikit-learn**, **seaborn**, and **NumPy**, but also taught me practical software development and deployment skills.

In addition to machine learning, I contributed to hardware-software integration through institute projects such as **Prototyping a Universal Testing Machine** and building a bot for the **XLR8 robotics competition**, working with tools like **Fusion 360**, **Arduino IDE**, and embedded programming.

I take pride in my ability to adapt quickly, work collaboratively in teams, and learn independently when necessary. My experience as an **Operations Coordinator at E-Cell** and volunteering with **NSS** has also helped me grow as a responsible and organized individual.

I am now seeking a challenging tech role that allows me to solve meaningful problems at scale, write clean and efficient code, and grow as a full-stack problem-solver — be it in data engineering, software development, or applied machine learning. I believe my foundation, project experience, and passion for technology make me a strong fit for dynamic tech teams.

Sincerely,

Nadeem Shabir Mir
